

Problem Set 2

4. Model Size

(a) Input to hidden layer 1:

$$= (\text{No. of inputs}) \times (\text{no. of hidden nodes in layer 1})$$

$$= 32 \times 32 \quad \times \quad 10$$

$$= 10240$$

Hidden layer 1 to hidden layer 2 :

$$= (\text{no. of nodes in layer 1}) \times (\text{no. of nodes in layer 2})$$

$$= 10 \quad \times \quad 10$$

$$= 100$$

Hidden layer 2 to hidden layer 3 :

$$= \quad 10 \quad \times \quad 10$$

$$= \quad 100$$

Hidden layer 3 to hidden layer 4 :

$$= \quad 10 \quad \times \quad 10$$

$$= \quad 100$$

Hidden layer 4 to hidden layer 5 :

$$= \quad 10 \quad \times \quad 10$$

$$= \quad 100$$

Hidden layer 5 to output layer :

$$= (\text{no. of hidden nodes})_{\text{in layer 5}} \times (\text{no. of output nodes})$$

$$= \quad 10 \quad \times \quad 100$$

$$= \quad 1000$$

$$\begin{aligned}\therefore \text{Total no. of weights} \\ &= 10240 + 100 + 100 + 100 \\ &\quad + 100 + 1000 \\ &= \boxed{11640}\end{aligned}$$

$$\begin{aligned}\text{Number of biases} \\ &= (10 \times 5) + 100 \\ &= \boxed{150}\end{aligned}$$

$$\begin{aligned}\therefore \text{Total parameters} &= 11640 + 150 \\ &= \boxed{11790}\end{aligned}$$

Ans

(b) No. of learnable parameters in CNN =

$$\text{input} \times \text{output} + \text{biases}$$

if last layer
is dense,
 $\text{input} = \# \text{ of nodes}$

if last layer is
conv.,
 $\text{input} = \# \text{ of filters}$

$(\# \text{ of filters}) \times (\text{size of filters})$

of filters

$$\text{Input} = 32 \times 32 \times 3$$

All conv. layers have 5 3×3 filters.

No. of parameters b/w input layer & hidden layer 1:

$$\text{Weights} = 3 \times 5 \times 3 \times 3 = 135$$

$$\text{Biases} = 5$$

$$\therefore \text{Total} = 140.$$

No. of parameters b/w hidden layer 1 & hidden layer 2:

$$\begin{aligned}\text{Weights} &= 5 \times 5 \times 3 \times 3 \\ &= 225\end{aligned}$$

$$\text{Biases} = 5$$

$$\therefore \text{Total} = 230$$

No. of parameters b/w hidden layer 2 & hidden layer 3:

$$\begin{aligned}\text{Weights} &= 5 \times 5 \times 3 \times 3 \\ &= 225\end{aligned}$$

$$\text{Biases} = 5$$

$$\therefore \text{Total} = 230$$

Similarly, no. of parameters b/w layers 3 & 4 and layers 4 & 5 will be 230.

No. of parameters b/w hidden layer 5 & output layer:

(We assume zero padding, \therefore size of input remains the same)

We flatten the output from the last conv-layer.

$$\begin{aligned}\therefore \text{No. of weights} &= 32 \times 32 \times 5 \\ &= 5120 \times 100 \\ &= 512000\end{aligned}$$

$$\text{No. of classes} = 100$$

$$\therefore \text{Total} = 512000$$

$$\begin{aligned}\therefore \text{Total learnable parameters} &= \\ &140 + (230 \times 4) + 512000 \\ &= \boxed{513160} \quad \underline{\text{Ans}}\end{aligned}$$

5.) (c)

1	1	0	2
4	0	8	10
6	4	2	0
8	7	4	2
10	7	5	1

The filter size is 3×3 .

\therefore for SAME padding : $p = \frac{3 - 1}{2} = 1$

0	0	0	0	0	0
0	1	1	0	2	0
0	4	0	8	10	0
0	6	4	2	0	0
0	8	7	4	2	0
0	10	7	5	1	0
0	0	0	0	0	0

$$0 \cdot 3 + 2 \cdot 4 \\ + 2$$

0	0	0	0	0	0
0	1	1	0	2	0
0	4	0	8	10	0
0	6	4	2	0	0
0	8	7	4	2	0
0	10	7	5	1	0
0	0	0	0	0	0
